Introduction

Overview of Vanguard and the Digital Challenge

Vanguard is a leading investment management company facing challenges with user drop-off in digital journeys. Issues such as confusion, clutter, and an uninviting design prompted a redesign to enable clients to make confident financial choices.

Main Question: Did the New UI Lead to Higher Completion Rates?

The main inquiry revolves around the effectiveness of the redesigned UI in increasing client engagement and completion rates. Measuring changes in user interaction will determine if the design overhaul successfully addresses previous digital journey drop-offs.

Data Overview

Datasets Utilized

Three primary datasets informed this analysis: Client Profiles detailing user demographics and preferences, Digital Footprints capturing users' online behaviors, and the Experiment Roster which outlined the specific clients involved in the A/B test. This combination enabled a comprehensive understanding of client interactions with Vanguard's digital interface.

Data Cleaning Process

Data processing involved extensive cleaning to ensure reliability, inconsistent entries, duplicates, and missing values were identified and rectified, ensuring that the datasets accurately reflected client interactions. This meticulous data preparation is crucial for achieving valid analysis results.

Merging Data for Insight

The merging process integrated the three datasets into a cohesive framework, allowing for cross-referencing of demographics with behaviors and experiment participation. This unified dataset provided a robust basis for analysis and facilitated a more holistic understanding of the impact of the new UI.

Experiment Design and Performance Metrics

Experiment Design and Performance Metrics

A/B Test Setup: Control vs. Test Group

Conducted between March and June 2017, the A/B test involved over 69,000 clients. The Control Group experienced Vanguard's old user interface while the Test Group interacted with the newly redesigned interface to assess differences in completion rates.

Key Performance Indicators (KPIs) Defined

The KPIs selected for this analysis included completion rates, user engagement metrics, and time spent per step in the interface. These measurements were critical to determining the impact of the new UI on client behavior and satisfaction.

Comparison of KPIs: Control Group vs. Test Group

The Test Group achieved a completion rate increase of 8.6% over the Control Group. Statistical analysis, with $Z = -22.26$ and $p < 0.001$, confirmed a significant difference, indicating that the new UI effectively improved user experience and completion rates.

Introduction

Data Overview

Key Findings and Recommendations

Experiment Design and Performance Metrics

Completion Rates and Statistical Significance

The Test Group exhibited an 8.6% higher completion rate compared to the Control Group. Statistical analysis ($Z = -22.76$; $p < 0.001$) confirms this difference as statistically significant, highlighting the effectiveness of the new UI in driving user engagement.

Key Findings and Recommendations

Demographic Insights: Engagement Patterns

Clients aged 18-34 displayed the highest completion rates, while those with 6-10 years of tenure were the most engaged. These insights suggest tailoring user experiences based on demographic characteristics could further enhance engagement and completion.

Completion Rates and Statistical Significance

The Test Group exhibited an 8.6% higher completion rate compared to the Control Group. Statistical analysis ($\chi^2 = 23.24, p < 0.001$) confirms this difference is statistically significant, highlighting the effectiveness of the new UI in driving user engagement.

Recommendations: Rollout and Testing Strategies

It is recommended to fully implement the new UI for all users, while simultaneously conducting step-wise testing of specific elements. Separate testing for mobile UX is crucial, alongside gathering qualitative user feedback to understand drop-off reasons.

Learnings on User-Centric Design

The project reinforces that user-centric design is vital for effective digital interfaces. Continuous improvement through A/B testing & research, understanding that every click reflects a user decision should guide future design efforts.
